Presentation Speech

Slide 1 – Title and Introduction

Tiina: Good evening, ladies and gentlemen. My name is Tiina, and together with Mariia, Juan, and Joni, I am here to present our web programming project. It is called Filmio.

Filmio is a movie website. You can search for films and see information about them, write reviews, save your favourite movies and share your list, create and join groups, and chat with other group members.

Slide 2 – Team and Roles

Tiina: Let's start with our team. Everyone contributed to all the features, but we each focused on different areas. I spent most of my time on styling, responsive design, and the favourites feature. Now I'll hand over to Juan.

Juan: Thank you. I'm Juan. I spent most of my time working on the chat, user accounts, and reviews. Next, Joni will introduce himself.

Joni: I'm Joni. I spent most of my time working on movie search and the page that lists all the groups. Mariia will continue.

Mariia: And I'm Mariia. I spent most of my time working on the home page, the individual group page, and the individual movie page.

Slide 3 – Key Features and Demo

Tiina: Now let's look at the key features. Let's start with the movie pages. On the home page, you can see the movies that are currently in cinemas. A new user can sign up with an email address and a password and then log in. Here, I'm searching for a movie and opening its page. A logged-in user can write a review and give the movie a rating from one to five stars. Next, Joni will show you the groups.

Joni: Thank you, Tiina. Groups are the social part of Filmio. I can create a group and become its owner. Here, I can invite a member by email. Users can also send a request to join a group, and the owner decides whether to accept it. Only the owner can remove members or delete the group. If the owner deletes their account, the group still exists and continues to work.

Now I'll show you the group chat. Every group has a real-time chat. This is an additional feature that we built using a library called Socket.IO. It enables low-latency, two-way communication between clients and the server. Each group has its own chat room, ensuring that messages are

delivered to the correct group members. When I send a message here, it appears immediately on the other screen without refreshing the page. Only group members can access the group page and participate in its chat.

Now Juan will show you how users can add movies to their favourites.

Juan: Thanks, Joni. I'll show you the favourites page. Here, I can add a movie to my favourites and create a link to share my list with a friend. On the My Account page, I can see invitations to join groups and accept or decline them. I can also log out or delete my account.

That's the end of the demo. Now Tiina will explain our feature checklist.

Slide 4 – Feature Checklist

Tiina: Here, you can see all the required features and how we implemented them. We completed all the requirements, and the features have been tested. The database diagram, user interface designs, timesheet, and API documentation are available in our Git repository.

Now Mariia will talk about the challenges we faced.

Slide 5 – Challenges

Mariia: We are all beginners in web development, so we faced and overcame several challenges. Our biggest technical challenge was the My Account page, which became blank when the token expired, preventing users from logging in or out. We fixed the issue, and now the page works correctly.

Now Juan will talk about our teamwork challenges.

Juan: Our biggest teamwork challenge was working on the same codebase. We often faced merge conflicts that took time to resolve. Once, duplicated code even caused every chat message to appear twice!

Now Joni will explain what we learned.

Slide 6 – Lessons Learned

Joni: So, what did we learn? Since we are all beginners, almost everything was new to us. We learned how to build a web application using React, Node.js, and a PostgreSQL database, as well as how to write basic tests.

Now Mariia will continue.

Mariia: We also learned how to use Socket.IO for our chat, work with cookies and CORS, handle database transactions, validate passwords using regular expressions, and understand common security vulnerabilities. We also learned how to run the application in Docker.

Now each of us will share a short personal reflection.

Slide 7 – Personal Reflection

Tiina: My biggest challenge was learning React. I also learned how to review my teammates' code. In future projects, I would like to improve my time management.

Joni: I found task estimation challenging. I became more confident in styling web pages and making them responsive. Next time, I would manage my time more effectively.

Mariia: What I struggled with most was writing tests. I also improved my understanding of programming syntax. In the future, I would break larger tasks into smaller ones.

Juan: One thing I found difficult was resolving Git conflicts. I developed my skills in resolving them. Next time, I would keep the codebase better organized.

Slide 8 – Conclusion

Juan: To sum up, Filmio is a fully functional movie website. We are proud that we have completed all the requirements and worked to make the application secure.

We are also happy to have worked together for the second project in a row. We worked well as a team, created a friendly and supportive environment, and everyone took responsibility for their part of the project.

In future projects, we aim to break tasks down into smaller, more manageable steps.

> Thank you for your time, and we hope you enjoyed our presentation!
